Resources (Above, plus:)

GPR2	MTEMP9 in byte#0
TEMP0 & TEMP1	Partial Product result from multiplication of a source 1 longword and a source 2 longword, MSD in byte#0 of TEMP1, LSB in byte#3 of TEMP0
TEMP2	Misc. data
TEMP3-TEMP6	Holds Source 2, memory format, LSB in byte#3 of TEMP3, MSB in byte#0 of TEMP6
TEMP7	Binary value of src.#2 longword
RTEMP8	Destination Length
RTEMP9	Destination Longword counter, values from 0-3 indicate which destination longword we are adding to:

0	1	2	3

and values -1 to -3 indicate we are pointing to "imaginary" longwords where ov. can occur

RTEMP10-RTEMP13	Holds Source #1, memory format, see description of source #2
MM.TEMP0	Misc. data
MM.TEMP1	Points to current source 1 longword as a 0-3 code, see description of destination pointer
MM.TEMP2	Misc. data
MM.TEMP5	Ditto *MM.TEMP0 is not needed after any call to IE.SERV.IP.TS2. MM.TEMPx are not referenced after any BUS exception or an int. is found pending*
MTEMP8-MERRCOD	Destination data, memory format, LSB in byte#3 of MTEMP8, MSB in byte#0 of MERRCOD. *MERRCOD is not referenced after any BUS exception.*
FPDOFFSET	ZLIT0[16.]
STEPC	I/O routine counter
RNUM	Points to current Source #2 TEMP
DREG	Copy of RNUM
QREG	Misc. data in Source 2-to-binary routine and DS.WRITF
FLAG0	DS.WRITE temp., masks PSL<C>
FLAG1	<V>image
FLAG2	1) Source 1 sign 2) <Z>image
FLAG3	1) Source 2 sign 2) <N>image

;32289 .TOC     "       Decimal String                  : DS.READ"
;32290
;32291          ;*****************************************************************************
;32292          ; DS.READ has 3 entry points:
;32293          ; 1) DS.READ: to read a Packed Decimal string into TEMP3-TEMP6.
;32294          ; 2) DS.READ: on an IR<2-0>? BUT to read a Packed Decimal string into
;32295          ;    TEMP3-TEMP6.  =101 is CMPP3[35], and the READ takes place as if
;32296          ;    the routine was entered directly at DS.READ:.  =111 is CMPP4[37],
;32297          ;    and VA is reloaded with a different address, the length offset from
;32298          ;    the adjusted "base address".  This costs 1 extra cycle. Please
;32299          ;    read the banners on the CMPP4 and CMPP3 instructions.
;32300          ; 3) DS.READ.DIVP.DR: to read a Packed Decimal string into
;32301          ;    RTEMP8-RTEMP11 and perform the manipulation & digit counting that
;32302          ;    DIVP requires.
;32303          ;
;32304          ; In this banner "*" means for code which enters at DS.READ: and takes
;32305          ;                  either split (=101 or =111).
;32306          ;                  "%" means for code which enters at DS.READ.DIVP.DR:.
;32307          ;                  "$" means for code which enters at the =111 split off
;32308          ;                  DS.READ:.
;32309          ;                  nothing means for both.
;32310          ;
;32311          ;       Input           Intcheck        Made no more than
;32312          ;                                       <Max. loop>-27. cycles before
;32313          ;                                       calling routine.
;32314          ;                       VA              (Base address of string)+(L/2+1)

;37038
;37039  ; REV   EXPLAINATION
;37040
;37041  ; 45    Modify machine check(utrap 28:) routine for TB parity error recovery.
;37042  ;
;37043  ; 44    Read modify ACVs go thru read ACV micro trap, and must be
;37044  ;       detected, so just taking a read tbmiss is no good.
;37045  ;       Disable interrupts during logging of machine check.
;37046  ; 43    CANCEL XFC fix of 39
;37047  ;       Fix interval timer problem.
;37048  ;       Make changes for CMODE reserved opcodes (see CMODE revision 20).
;37049  ;       Ensure that a TB-miss and ACC Violation don't cause problems
;37050  ;       Assign permanent addresses to free locations (where possible)
;37051  ; 42    Reassign FEE  with 3EF
;37052  ;       Fix unaligned read across a page boundary to not clobber VA if a fault it taken with FPD=1
;37053  ;       on the second half of the read.
;37054  ;       More on unaligned read bug.  Was causing KSNV because stack flag was left set if tb miss
;37055  ;       routine tried to service an interrupt.
;37056  ;       Fix machine check code to set MM.NOINT before pushing params on stack.
;37057  ; 41    Fix when FPD set & access violation & no TB miss i.e. the PTE is in the TB but access is not
;37058  ;       allowed the MDR will not be clobbered.
;37059  ; 40    Use location 3EE instead of FEE to avoid ROM changes
;37060  ; 39    Fix XFC instruction to Back-up the PC by one and clear all flags before going to WCS.
;37061  ;       Fix "REI" instruction to check for odd PC when entering compatibility mode
;37062  ; 38    5/19/80
;37063  ;       Cleanup and improve the comments.
;37064  ;       5/29/80
;37065  ;       Add special pack routine entry for CVTTP destination length 0.
;37066  ;       6/19/80
;37067  ;       Fix machine check to disable cache on cache parity errors.
;37068  ; 37    Fix FD opcode decode.
;37069  ;       Remove Q_0 from FX.IE.FD.RET.
;37070  ;       Fix WRT BUS ERR double error halt.  Change halt code to 5.
;37071  ;       Clear FPA traps to avoid erroneous trap.
;37072  ;       Set stack flag on halts to tell console to look at front panel.
;37073  ;       Load PC with SCBB+offset on halt due to vector<1:0>=3.
;37074  ;       Fix disabling of cache on cache machine checks.
;37075  ;       Fix console interrupts to properly clear transmitter interrupts.
;37076  ;       Fix handling of FPA detected faults.
;37077  ;       Load VA and set MM.NOINT for interlocked queues with FPD set.
;37078  ;       Fix KSNV to always raise the IPL to 1F.
;37079  ; 36    Initial release.
                                        ;37080         .BIN

                                ;38789 ;
                                ;38790 ;       This routine does micro service of the interval timer.
                                ;38791 ;       It has two functions, transfer the SPNICR into the SPICR and
                                ;38792 ;       increment the SPICR.
                                ;38793 ;
                                ;38794 ;       SPNICR is the upper 16 bits of the NICR, and
                                ;38795 ;       SPICR is the upper 16 bits of the ICR.
                                ;38796 ;       These are both stored in one 32 bit register called SPNICR.SPICR.
                                ;38797 ;       SPNICR.SPICR actually contains SPICR+1 in the lower 16 bits and
                                ;38798 ;       SPNICR in the upper 16 bits.  This is done so that when SPICR is
                                ;38799 ;       incremented to a state of all ones ( time to set VP ) the stored value
                                ;38800 ;       will be zero making testing easy (MFPR must take this into account).

;39603
;39604  ; REV   EXPLANATION
;39605
;39606  ; 30    Set flags in MM.GET.PTE and MM.GET.WRITE.PTE for TB parity error
;39607  ;       recovery.
;39608  ; 29    Set MM.NOINT when processing a page boundary write to avoid
;39609  ;       servicing an interrupt after writting the first page.
;39610  ;       used loc 1672
;39611  ; 28    Clear TB to avoid possible conflict between access violation
;39612  ;       and XB - TB-miss.
;39613  ; 27    Fix such that the VA will not be off by 4 when reading across
;39614  ;       a page boundry and FPD set and you restart the instruction.
;39615  ; 26    Fix such that the VA will not be off by 8 when writing crossing
;39616  ;       a page boundery and FPD set and you restart the instruction
;39617  ; 25    Change location 15FC to clear the TB  to avoid a conflict
;39618  ;       between an access violation and a xb-tb miss.
;39619  ; 24    Add label MM_PCALL_ACV_ENTRY for CALLx to jump to on ACV's
;39620  ; 23    Fix bug in MM.PRB.WRITE.SIZ if probe crosses a page boundary.
;39621  ;       Fix MM.PB.PROBE to properly restore MDR.
;39622  ;       Add BUS/PRB.RD.PTE to avoid machine hang loading the TB.
;39623  ; 22    Initial release.
                                        ;39624          .BIN

;40097 .TOC "  Memory Management                  : MM.GET.WRITE.PTE"
;40098
;40099 ;*************************************************************************
;40100 ;       Entry Points    MM.GET.WRITE.PTE
;40101 ;
;40102 ;       Input           VA                  Faulting address
;40103 ;
;40104 ;       Subroutines     MM.GET.PTE
;40105 ;                       IE.SERV.IP.TS
;40106 ;                       MM.WRITE.SPTE
;40107 ;
;40108 ;       Resources       MM.TEMP1            Save VA
;40109 ;                       MM.TEMP2            Save MDR
;40110 ;                       MM.TEMP3            Save faulting address
;40111 ;                       MM.TEMP5            Save new PTE rotated for TB loading
;40112 ;
;40113 ;       MM.GET.WRITE.PTE CALLS MM.GET.PTE TO FETCH THE PTE INTO MDR.
;40114 ;       MM.GET.PTE RETURNS 4 WAYS, ONE FOR ACV, ONE FOR TNV, ONE IF THE
;40115 ;       PTE IS IN MDR AND VA CONTAINS THE VIRTUAL ADDRESS OF THE PTE,
;40116 ;       AND ONE IF THE PTE IS IN MDR AND VA CONTAINS THE PHYSICAL ADDRESS
;40117 ;       OF THE PTE.  THESE LAST TWO ARE TO ALLOW MODIFYING OF THE PTE IN
;40118 ;       MEMORY IF PTE<M>=0.  ONCE THE PTE IS IN MDR IT IS CHECKED
;40119 ;       FOR WRITE ACCESS.  IF OK AND PTE<M>=1 THEN THE PTE IS LOADED INTO
;40120 ;       THE TB.  IF THERE IS AN ACV OR TNV THE WRITE BIT IS SET IN THE
;40121 ;       ERROR CODE AND THE FAULT IS INITIATED.
;40122 ;
;40123 ;       IF THE ACCESS IS OK AND PTE<M>=0 THEN THE PTE IS MODIFIED AND WRITTEN
;40124 ;       BACK TO MEMORY BEFORE LOADING IT INTO THE TB. IF PTE<M>=0 AND VA
;40125 ;       CONTAINS THE VIRTUAL ADDRESS OF THE PTE, IT IS NECESSARY TO
;40126 ;       CHECK THAT THE SYSTEM PTE FOR THAT PROCESS PTE HAS ITS MODIFY BIT
;40127 ;       SET. IF SPTE<M>=0 THEN THE ENTRY IN THE TB IS MODIFIED TO AVOID
;40128 ;       A WRITE M=0 MICRO TRAP WHEN WRITING THE PROCESS PTE OUT TO MEMORY.

;40948  .TOC "  Revision History"
;40949
;40950  ; REV   EXPLAINATION
;40951
;40952  ; 21    Cause ODD Address traps when the SP is odd in JSR, RTS, MFPx, MTPx and
;40953  ;       RTI/RTT
;40954  ; 20    Trap reserved opcodes that get confused with RTI, RTT, RTS, IOT and BPT.
;40955  ;       Fix ODD address check of operands with RTS,JSR, JMP
;40956  ;       Recover locations 147C and 147D
;40957  ; 19    Fix JSR to detect an illegal destination mode "0" at
;40958  ;       the beginning og the instruction.
;40959  ;       Fix the DIV to not set the "V" bit when the quotient equals 8000
;40960  ;       Fix the TSTB instruction to execute as a TSTB when the
;40961  ;       destination address is the PC.
;40962  ;       DIV:    The remainder is not of the same sign as the dividend
;40963  ;               when the operands are of a differend sign.
;40964  ; 18    DIV:    Zero is an acceptable "expected-negative" result.
;40965  ;               Fix problem that called it overflow and left result unwritten.
;40966  ;       MUL:    Fix bug mentioned in  17
;40967  ;       ASH:    Left shift should not overflow when result sign = original sign.
;40968  ;               Sign extending Q before the test fixes the problem.
;40969  ; 17    MUL; Vbit should not be set when result most neg no.
;40970  ;       Fix ASH to not set the V bit if the bits shifted out are of the
;40971  ;       same sign as the sign of the original and final operand.
;40972  ;16     Initial release.
                                        ;40973          .BIN

;44320  ; REV   EXPLAINATION
;44321
;44322  ; 31    Fix OS.ADD_INC.PC for instruction PUSHAQ & MOVAQ
;44323  ; 30    Code around an undocumented hardware conflict that causes
;44324  ;       MDR_0 and IRDX in the same cycle not to work properly,
;44325  ;       causing QUAD and DOUBLE short literals not to work properly
;44326  ;       when they are the last byte on a page and there
;44327  ;       is a IB MISS on the next page.
;44328  ;29    29-MAY-1980
;44329  ;       Fix indexed immediate in OS.BOA.QUAD.
;44330  ;28    Fix indexed immediate.
;44331  ;       Change immediate mode for write type operands to take an addressing
;44332  ;       mode fault.
;44333  ;27    Initial release.

;46101 .TOC "  MICRO VERIFY                        : TEST INITIALIZATION"
;46102
;46103 ;*************************************************************************
;46104 ;       The micro verify routines are invoked by doing a PUSH,NEXT/MV.TEST and
;46105 ;       upon successful completion a RETURN [+1] is done.
;46106 ;
;46107 ;       At the start of micro verify, a '%' is typed at the console.  If
;46108 ;       all tests run successfully, a second '%' is typed.  If an error is
;46109 ;       detected, a single error character (see list below) is typed at the
;46110 ;       console and then the CPU is halted in console mode.  When the CPU
;46111 ;       halts an error code will be typed in place of the PC (see list below)
;46112 ;       and a halt code of /tbs/ which will indicate this halt is due to an
;46113 ;       error condition in micro verify.
;46114 ;
;46115 ;       The following is a list or the test sections and their associated
;46116 ;       error codes (for a complete error list see CHARTS):
;46117 ;
;46118 ;               PC+2(see below) CHAR            TEST NAME
;46119 ;               0000000X        @               R-BUS, W-BUS, D-REG TEST
;46120 ;               0000003X        C               M-BUS, Q-REG TEST
;46121 ;               0000005X        E               SCRATCH PAD TEST

;46498
;46499 ;*************************************************************************
;46500 ;
;46501 ;       Resources       LONLIT          Constant 11111111
;46502 ;                       QREG    Temp to hold test value.
;46503 ;                       DREG            Hold register number for loading RNUM.
;46504 ;                       RNUM            Used for addressing scratch pads.
;46505 ;                       MTEMP8          Constant 11111111 for R-bus scratch pads
;46506 ;                                          {  0 - loading RTEMPs.
;46507 ;                       FLAG<1:0>          {  1 - loading GPRs.
;46508 ;                                          {  2 - not used.
;46509 ;                                          {  3 - loading MTEMP8 (end setup).
;46510 ;
;46511 ;       This section tests that the scratch pads can be addressed explicitly
;46512 ;       instead of using RNUM (ie MSRC/TEMP0 instead of MSRC/TEMP.R).
;46513 ;       First all R-bus scratch pads and MTEMP8 are loaded with their
;46514 ;       address in all 8 nibbles(ie RTEMP3=33333333, GPR14=EEEEEEEE).
;46515 ;       Then the registers with addresses 0,1,2,4 and 8 are read explicitly.
;46516 ;       The dual ports are written only from RSRC but are read from both sides.
