```
                                        ;1      .TOC    "REV750.MIC"
                                        ;2      .TOC    "REVISION 98"
                                        ;3      ;       Jeff Peng, J.Heom, Gerard Koeckhoven, Brian Allison, C. E. MCDOWELL
                                        ;4
                                        ;5      .SET/MICROREV=98.
;6      .NOBIN
;8          ;       This revision history indicates which modules have changed, and a SUMMARY of those changes.
;9          ;       Individual revision histories should be consulted for descriptions of the
;10         ;       changes.  The location of each revision history is available from the table
;11         ;       of contents.
;12         ;
;13         ; REV   EXPLAINATION
;14         ;
;15         ; 98    MM      -       Set flags in MM.GET.WRITE.PTE and MM.GET.PTE for TB parity error recovery
;16         ;       IANDF   -       Modify Machine Check routine (uTRAP address 28:) to recovery TB parity error
;17         ;
;18         ; 97    DEFIN   -       Modify VALIDITY check V024 to verify BUS vs MSRC conflict
;19         ;       INSQTI  -       Fix BUS/PROBE.WR and MSRC/TEMP4 hardware conflict.
;20         ;
;21         ; 96    DEFIN   -       Increase the width of micro-word to 81 bits. Add a PATCH field in bit #80.
;22         ;                       Move VSIZE field into bit #84.
;23         ;       PCALL   -       Fix CALLS  and CALLG with write-protected stack area.
;24         ;       OSR     -       Fix instructions PUSHAQ and MOVAQ which increase PC incorrectly.
;25         ;       MPRCHM  -       Jump to PCS to set microrev in SID register.
;26         ;       MISQUE  -       Fix instruction INSQHI with reserved operand.
;27         ;       DECMAL  -       Location 1312 and 1313 remain unused.
;28         ;
;29         ; 95    Replace CCS bread board with PCS.
;30         ;
;31         ; 94    Revision numbers 63 thru 93 were not used to allow the changing as
;32         ;       few roms as possible when changing the rev # for the next change.
;33         ;
;34         ;       MM      -       Save flags and then set MM.NOINT when modifying
;35         ;                       an unaligned operand that is crossing a page boundary.
;36         ;                       Flags are then restored.
;37         ;       MISQUE  -       Save MMTEMP3 (which has the faulting address which aborted the
;38         ;                       instruction) in temp6. This prevents MM from destroying the
;39         ;                       information if a tb-miss occurs when unlocking
;40         ;                       the header. MMTEMP3 is then restored.
;41         ;               -       Additional check provided for the case of a software interlock set and checking of
;42         ;                       bits 1 and 2, if not zero, then reserved operand.
;43         ;       DECMAL  -       Set mm.noint prior to and clearing it afterwards when writing
;44         ;                       data that crosses a page boundary in the general purpose
;45         ;                       write routine for the decimal instructions.
;46         ;               -       some routines were merged to gain some ucode locations in row 5 of ccs
;47         ;       FLOAT   -       use the correct temp (temp3) instead of temp1 in FP IRD1
;48         ;                       specifically for FPA
;49         ;       FILLER  -       remove loc FF7 and FFA for MM fix
;50         ;
;51         ; 93
;52         ;       CHARTS  -       Change some documentation and add a few charts
;53         ;       INIT    -       Fix the 2 changes made in Rev 24
;54         ;                       REassign locations to get return -19 working
;55         ;                       Change BO.INIT_UBA_MAPS to be a subroutine that is called on
```

```
                        both cold and warm boots.
        CONSOL  -       Fix B/number to work without specifying the device.
        INTLOG  -       Remove free location
        FLOAT   -       Fix a POLYD problem that causes the VA to be incorrect, when the arg =0,
                        and the degree not equal to zero and doing a read with FPD set.
                        Recover locations 232 and 233 for use in IANDE.MIC
                        Assign permanent addresses to free locations (where possible)
        VIELD   -       Force some address.
        CONTRL  -       Force some addresses
        CHAR    -       Swap a couple un-constrained words with INIT.MIC to make a return -19
                        work correctly.
        DECMAL  -       Set MM.NOINT during the write of CVTPL to avoid problem with
                        the Write Crossing Page Boundry routine.
        PRLDSV  -       Fix PROBE instructions to flush the XB after restoring the PSL to
                        avoid erroneous ACVs due to prefetch while PSL had modified current
                        mode bits to execute the probe.  Also fix to report no access if
                        probe across a page boundary with first page access ok but not valid,
                        and second page no access.
        IANDE   -       Read modify ACVs go thru read ACV micro trap, and must be
                        detected, so just taking a read tbmiss is no good.
                        Disable interrupts during logging of machine check.
        MM      -       Clear TB to avoid possible conflict between access violation and XB - TB-miss.
        CMODE   -       Cause ODD Address traps when the SP is odd in JSR, RTS, MFPx, MTPx and RTI/RTT
        UVERFY  -       Clean up DSIZE test.
        FILLER  -       Remove words for CMT061.

; 61    DO EVERYTHING
; 60    THIS IS AN INTERIM ECO
        CMODE   -       Fix ODD address check of operands with RTS,JSR, JMP
        INTLOG  -       Recover FREE.00C and FREE.00D, now used in IANDE.
        IANDE   -       More on unaligned read bug.  Was causing KSNV because stack flag was left set if tb miss
                        routine tried to service an interrupt.

; 59    THIS IS AN INTERIM ECO
        CHARTS  -       Documentation change
        MM      -       Fix such that the VA will not be off by 4 when reading across
                        a page boundry and FPD set and you restart the instruction.
        IANDE   -       Reassign FEE  with 3EF
                        Fix unaligned read across a page boundary to not clobber VA if a fault it taken with FPD=1
                        on the second half of the read.
        CHAR    -       Fix SKPC to read longword aligned
                        Change word to long when comparing scr len with dest len
        DECMAL  -       ASHP:    Change byte to word
        CMODE   -       Remove free locations 147c and 147d
        UVERFY  -       Remove free locations 173A and 173B
        FILLER  -       Put 3EF in filler and remove FEE
                        Remove words for CMT059

; 58    THIS IS AN INTERIM ECO
        CHAR    -       Fix problem with R0 in MATCHC
        MM      -       Fix such that the VA will not be off by 8 when writing crossing
                        a page boundery and FPD set and you restart the instruction
        IANDE   -       Fix when FPD set & access violation & no TB miss i.e. the PTE is in the TB but access is not
                        allowed the MDR will not be clobbered.
        FILLER  -       Remove two words for fix in char and mm
```

```
;111
;112     ; 57    THIS IS AN INTERIM ECO
;113     ;       CHAR    -       Optimize MATCHC fix
;114     ;       EDIT    -       Fix EDITPC to get proper data in R5
;115     ;       IANDE   -       Use location 3EE instead of FEE to avoid ROM changes
;116     ;       FILLER  -       Add four words to filler from MATCHC optimization
;117     ;                       SWAP loc FEE with 3EF ,
;118
;119     ; 56    THIS IS AN INTERIM ECO
;120     ;       MM      -       Change location 15FC so that the TB gets cleared. This is
;121     ;                       to avoid a conflict between an access violation and a xb-tb miss.
;122     ;       FLOAT   -       Use locations 232 and 233 for a fix in IANDE but leave them in float
;123     ;                       Fix POLYD and POLYF instructions. Change two locations from word to long.
;124     ;       INTLOG  -       Reassign addresses in EDIV routine, and restore micro-address in
;125     ;                       ADWC routine, which was previously swapped to fix EDIV problem.
;126     ;       CMODE   -       JSR:    Make JSR look for reserved operand fault (register mode)
;127     ;                               at beginning of instruction so PC doesn't get changed.
;128     ;                       TSTB:   Change size[word] to size[idep] when register mode pc
;129     ;       FILLER  -       Remove some microwords
;130
;131     ; 55    THIS IS AN INTERIM ECO
;132     ;       INTLOG  -       Assign permanent addresses to IL.EDIVC and IL.EDIVC1
;133     ;       PCALL   -       The "CALLS and CALLG" instructions have to read the
;134     ;                       mask as a word instead of a longword.
;135     ;       CHAR    -       Fix MATCHC bug fixed in 18
;136     ;       DECMAL  -       Whenever the src len > dest len and the source string is not
;137     ;                       equal to zero and the first byte after a possible zero
;138     ;                       byte is not an illegal ascii character then a
;139     ;                       reserved operand fault will occur.
;140     ;       IANDE   -       When going to WCS using the "XFC" instruction the PC has to
;141     ;                       be backed up and all flags cleared.
;142     ;                       When going to Compatibility Mode check that the first
;143     ;                       PC in CMODE is not ODD.
;144     ;       CMODE   -       DIV:    Zero is an acceptable "expected-negative" result.
;145     ;                               Fix problem that called it overflow and left result unwritten.
;146     ;                       MUL:    Fix bug mentioned in 17
;147     ;                       ASH:    Left shift should not overflow when result sign = original sign.
;148     ;                               Sign extending Q before the test fixes the problem.
;149     ;       FILLER  -       Delete words for rev 55 changes.
;150
;151
;152     ; 54    THIS IS AN INTERIM ECO
;153     ;       OSR -           Code around an undocumented hardware conflict that causes
;154     ;                       MDR_0 and IRDX in the same cycle not to work properly.
;155     ;                       causing QUAD and DOUBLE short literals not to work properly
;156     ;                       when they are the last byte on a page and there
;157     ;                       is a TB MISS on the next page.
;158     ;       DECMAL -        Fix illegal # detection in CVTTP
;159     ;                       In CVTPS instruction the Z-bit was not cleared when source length = 1
;160
;161     ; 54    MISQUE -        Fix problem in QU.UNLOCK routine to restore registers properly when
;162     ;                       faulted out of an instruction using an auto-increment or auto-decrement
;163     ;                       addressing mode.
;164     ;       CMODE -         ASH: Vbit should be cleared if sign of result is
;165     ;                       the same as sign of original operand.
```

```
;166     ;          EDIT -          Fix EDITPC to get proper result in R0, R1
;167     ;          CHAR -          Fix MATCHC bug if obj length > src length
;168     ;          INTLOG -        Swap a micro-address in ADWC routine to fix a bug in EDIV
;169     ;                          Fix EDIV problem such that largest negative number is acceptable.
;170     ;
;171     ;  53      CONSOL -        Fix D P<CR> to not deposit a zero in the PSL.
;172     ;          PRLDSV -        Fix SVPCTX to save the SP in KSP (as well as the PCB) when executed on the kerral stack.
;173     ;          FLOAT -         Fix EMODD to not generate a dirty zero on cases with extreme overflow.
;174     ;          INIT -          Fix invalidating of the TB to not miss the first two locations.
;175     ;          OSR -           Fix OS.BOA.QUAD indexed immediate to return the proper address.
;176     ;          DECMAL -        Fix CVTTP to clear the high nibble of a zero length destination when a page fault occurs trying
;177     ;                          to write the destination.
;178     ;                          Fix CVTLP to properly set/clear Z if overflow occurs.
;179     ;                          Fix CVTPT and CVTPS to properly set CC's for destination length = 0.
;180     ;                          Fix CVTTP and CVTSP to take a reserved operand fault for all illegal bytes that overflow.
;181     ;                          Fix CVTPS and CVTPT to set Z if the srclen > dstlen and dstlen is even.
;182     ;          EDITPC -        Fix REPLACE_SIGN to work if a page fault occurs trying to do the fix up.
;183     ;          IANDE -         Fix machine check code to disable cache on cache parity errors.
;184     ;          MACRO -         New macros for G and H.
;185     ;  52      PCALL -         Fix CALLx to pass the right faulting address on an ACV to memory management.
;186     ;          MM -            Add a label for the fix in PCALL to jump to.
;187     ;          MISQUE -        Fix REMQxI reg dest to properly disable header .ne. addr check
;188     ;          MPRCHM -        Add a BUS/PRB.RD.PTE.K to micro word 0DFA to cure a deadlock problem that
;189     ;                          occurs when running 3 massbuses at the same time
;190     ;  51 ******************** Rev 51 was skipped to save a ROM in an ECO.
;191     ;  50      MISQUE -        Fix interlocked queues to page fault properly.
;192     ;  49      DECMAL -        Fix converts to save/restore the flags when taking an interrupt with FPD set.
;193     ;                          Fix DIVP infinite loop on illegal data bug.
;194     ;          IANDE -         Fix FD opcode decode.
;195     ;                          Remove Q_0 from FX.IE.FD.RET.
;196     ;                          Fix WRT BUS ERR double error halt.  Change halt code to 5.
;197     ;                          Clear FPA traps to avoid erroneous trap.
;198     ;                          Set stack flag on halts to tell console to look at front panel.
;199     ;                          Load PC with SCBB+offset on halt due to vector<1:0>=3.
;200     ;                          Fix disabling of cache on cache machine checks.
;201     ;                          Fix console interrupts to properly clear transmitter interrupts.
;202     ;                          Fix handling of FPA detected faults.
;203     ;                          Fix raising of IPL to 1F on KSNV.
;204     ;
;205     ;  49      FLOAT -         Fix POLYD accuracy and dirty zero bugs.
;206     ;                          Put in rom section of G and H floating.
;207     ;                          Change CRC to clear PSL<C>.
;208     ;                          Change ACBF and ACBD for compatability wiht G and H floating.
;209     ;                          Fix condition codes for CMPD with the FPA.
;210     ;                          Fix size on FPA converts.
;211     ;          GHFLT -         Add G and H floating.
;212     ;          INIT -          Turn off the cache when doing memory test for booting.
;213     ;                          Initialize the UNIBUS in the INIT code.
;214     ;                          Clear TU58 control and status registers in INIT.
;215     ;                          Avoid machine hang clearing TB and CACHE.
;216     ;
;217     ;  49      CONSOL -        Attempt restart for halt codes other than 6.
;218     ;                          Fix clearing of halt pending on restart.
;219     ;          INTLOG -        Fix FPA interface bugs.
;220     ;          PCALL -         Fix CALL and RET to do exact probe if approcimate probe gets TNV.
```

```
;221     ;       MISQUE -        Make change for doing restarts on HALT.
;222     ;                       Fix interlocked queues to set MM.NOINT before trying to clear the lock if reserved operand.
;223     ;       MPRCHM -        Fix deposit to IORESET from the console to not take interrupts.
;224     ;                       Change FPA present IPR to use a branch so it will work from the console.
;225     ;                       Avoid machine hang clearing TB and CACHE.
;226     ;
;227     ;       OSR -           Fix indexed immediate.
;228     ;                       Change write type immediate operands to properly bump the PC.
;229     ;       MM -            Fix bug in MM.PRB.WRITE.SIZ when address crosses a page boundary.
;230     ;                       Fix MM.PB.PROBE to properly restore MDR.
;231     ;                       Fix MM.GET.WRITE.PTE to restore VA for TNV fetching process PTE.
;232     ;                       Avoid machine hang loading the TB.
;233     ;       CHAR -          Fix FPD bug in MATCHC.
;234     ;       PRLDSV -        Avoid machine hang clearing the TB.
;235     ;
;236     ; 48    Initial release to manufacturing.
```

;1464    .TOC "  Micro Level Charts                : Description of FPD "
;1465
;1466    ;  When PSL<FPD> is set, there are 4 things that might require the instruction
;1467    ;  flow to be interrupted and the instruction packed up.
;1468    ;
;1469    ;       1) Memory Fault (ACV or TNV),
;1470    ;       2) Reserved Operand Fault,
;1471    ;       3) Floating Point Fault (overflow, underflow), or
;1472    ;       4) Interrupt.
;1473    ;
;1474    ;  In the first case the memory management flows will branch to the
;1475    ;  pack routine at IE.FPD.PACK + FPDOFFSET, and initiate the fault.
;1476    ;
;1477    ;  In the second case the micro code will branch to IE.OPER.FAULT which
;1478    ;  will branch to the pack routine and initiate the fault.
;1479    ;
;1480    ;  In the third case the micro code will branch to IE.FLxxx.FAULT which
;1481    ;  will branch to the pack routine and initiate the fault.
;1482    ;
;1483    ;  In the fourth case when the micro code decides to allow an interrupt it will
;1484    ;  branch to IE.SERV.IP.IS which will branch to the pack routine and initiate
;1485    ;  the interrupt (interrupts may be taken by the memory management flows
;1486    ;  if a TB miss occurs and the flag MM.NOINT is clear).
;1487    ;
;1488    ;  The micro code pack routines loaded at IE.FPD.PACK + FPDOFFSET observe
;1489    ;  the following rules for packing:
;1490    ;
;1491    ;       1) When packing is complete the pack routine will branch
;1492    ;          to IE.PACK.DONE.
;1493    ;
;1494    ;       2) For faults, DREG is modified by IANDE before going to the
;1495    ;          pack routine and must not be modified by the pack routine.
;1496    ;
;1497    ;       3) For floating faults and reserved operand faults, FLAG2 is modified
;1498    ;          by IANDE before going to the pack routine and must not be modified
;1499    ;          by the pack routine.
;1500    ;
;1501    ;       4) Micro temp FPDOFFSET<16:8> is modified by IANDE before going to the
;1502    ;          pack routine and must not be modified by the pack routine
;1503    ;          (FPDOFFSET<7:0> will be preserved).
;1504    ;
;1505    ;       5) In some cases the pack routine may need to return to the instruction
;1506    ;          flows before branching to IE.PACK.DONE, if so the address at the
;1507    ;          top of the micro stack will have one of two possible values:
;1508    ;               a) IF the pack routine was branched to because of a memory
;1509    ;                  management fault or because of an interrupt taken from a
;1510    ;                  tbmiss routine (MM.NOINT clear)
;1511    ;                  THEN the address at the top of the micro stack is the
;1512    ;                  address of the micro trapped instruction that caused the
;1513    ;                  tb miss.
;1514    ;               b) IF the pack routine was reached by any other path
;1515    ;                  (ie. NEXT/IE.SERV.IP.IS or NEXT/IE.OPER.FAULT)
;1516    ;                  THEN the address at the top of the micro stack is the address
;1517    ;                  of the last unmatched PUSH in the instruction flows.
```

NOTE 1 : When the rotate value is equal to zero, the super rotator will rotate by 32.
The results will be as expected for all other rotate values.

NOTE 2 : When the shift value is equal to zero, the super rotator will output zero.
The results will be as expected for all other shift values.

;5294   ; REV   EXPLANATION
;5295   ; 25    Fix the 2 changes made in Rev 24
;5296   ;       REassign locations to get return -19 working
;5297   ;       Change BO.INIT_UBA_MAPS to be a subroutine that is called on
;5298   ;       both cold and warm boots.
;5299   ; 24    Change boot code to init the last 16 unibus addresses as not valid.
;5300   ;       Change boot code to make B/number work without specifying the device.
;5301   ; 23    29-MAY-1980
;5302   ;       Fix INIT code to invalidate 1st two locations in the TB.
;5303   ; 22    Turn off the cache when doing memory test for booting.
;5304   ;       Initialize the UNIBUS in the INIT code.
;5305   ;       Clear TU58 control and status registers in INIT.
;5306   ;       Add BUS/PRB.RD.PTE to avoid machine hang clearing TB and CACHE.
;5307   ;  21   Initial release.
                                        ;5308          .BIN

;10620  .NOBIN
;10621  .TOC "  Revision History"
;10622
;10623  ; 26    Fix FPA interface for unpacking short literal
;10624  ; 25    POLYF and POLYD have problem if 1st coefficient or any part product is 0
;10625  ;       because the result of the multiply step did not clear the
;10626  ;       working exp field
;10627  ; 24    Fix a POLYD problem negative part product underflowed and next
;10628  ;       coefficient is 0
;10629  ; 23    Fix a POLYD problem that causes the VA to be incorrect, when the arg =0,
;10630  ;       and the degree not equal to zero and doing a read with FPD set.
;10631  ;       Recover locations 232 and 233 for use in IANDE.MIC
;10632  ;       Assign permanent addresses to free locations (where possible)
;10633  ; 22    Use locations 232 and 233 for a fix in IANDE but leave them in FLOAT.
;10634  ;       Fix a ADDD,SUBD,EMODD problem, when doing any of these instructions
;10635  ;       and the high order number is zero before the normalization then the
;10636  ;       9 high order bits of the low order longword will be missing.
;10637  ;       Fix a POLYD and POLYF problem , which causes the fraction part
;10638  ;       of the result to be unpredictable when:
;10639  ;               a - the product step with exp(biased) = 0  and
;10640  ;               b - the fraction is between 1/4 and 1/2 and
;10641  ;               c - the coefficient exponent (biased) > 31
;10642  ; 21    Fix EMODD creating dirty zero if extreme overflow.
;10643  ;       Add some labels for G and H.
;10644  ; 20    FIX POLYD ACCURACY AND DIRTY ZERO BUGS.
;10645  ;       CHANGE CRC TO CLEAR PSL<C>.
;10646  ;       CHANGE TO ACBF AND ACBD FOR G AND H FLOAT TO SHARE.
;10647  ;       Fix bad litrl in POLYF and POLYD FPA interface.
;10648  ;       Fix setting of CC in FI.POLYFD.
;10649  ;       Add branch on regmode to FI.EMODD.
;10650  ;       Fix FPA interface for POLYF and POLYD.
;10651  ;       Fix FI.CMPD condition codes.
;10652  ;       Fix size on FPA converts.
;10653  ; 19    Initial release.
                                        ;10654          .BIN

;16375 ;                The argument is parsed and validated by FP.MULDOP2
;16376 ;                The degree is fetched by OS.RED. Upon return
;16377 ;                FPDOFFSET temp is set to 2 for POLYD instruction
;16378 ;                FP.POLYFD.SUBS gets the  address of the coefficient
;16379 ;                table and does the initial preparations sets FPD
;16380 ;                Upon return the 1st coefficient is saved in R0,R1
;16381 ;                the argument in R3,R4
;16382 ;                If the argument is 0 then
;16383 ;                        if the degree is 0 the end up routine is called
;16384 ;                        if the degree ne 0 then the answer is the last
;16385 ;                                coefficient which is fetched
;16386 ;                                by adding degree*8 to the tbladdr
;16387 ;                                R2 (bit 30) is set indicating
;16388 ;                                where to return should a fault occur
;                                       since FPD is already set
```

```
;16389 ;                        If the argument is not 0
;16390 ;                                The exponents are added and FP.PREOPS.POLYD
;16391 ;                                called to shift the operands
;16392 ;                                left and to call FP.MULD.SUB to perform the
;16393 ;                                multiplication.  Upon return 63 bits of the
;16394 ;                                product are saved and the next
;16395 ;                                coefficient is obtained and FP.ADDD.20 called
;16396 ;                                to perform the add, normalize round pack
;16397 ;                                Upon return the part product is saved in R0,R1
;16398 ;                                if no floating overflow or underflow FU bit set
;16399 ;                                At appropriate intervals checks are also
;16400 ;                                made for interrupts and timer .
;16401 ;                                To begin a second or nth iteration
;16402 ;                                the part product is unpacked and
;16403 ;                                the operation repeated until all coefficients
;16404 ;                                have been processed

; REV   EXPLAINATION

; 18    When execute the CALLS and CALLG instruction with write protected
;       stack area, the ERRCOD has to be set a proper value to indicate
;       ACV fault.
;
; 17    The "CALLS and CALLG" instructions have to read the
;       mask as a word instead of a longword.
; 16    Fix CALLx to pass proper address on ACV's to memory management
; 15    Fix CALLx and RET to do exact probe if approximate probe gets TNV.
; 14    Initial release.
                                      .BIN

;20871
;20872  ; 33    Fix the instruction of INSQHI with reserved operand.
;20873  ; 32    Save mmtemp3 prior to unlocking header in case of tb miss,
;20874  ;       caused by the entry purging the header from the tb,then restore.
;20875  ;       Check all 3 lsb of header, even if software inter-lock is set,
;20876  ;       and if bits 1 or 2 is set, take reserved operand fault
;20877  ;       Also acquire hardware interlock prior to unlocking header
;20878  ; 30    Fix problem in QU.UNLOCK routine to properly restore the registers
;20879  ;       when the instruction has faulted.
;20880  ; 29    Fix REMQxI reg mode dest to properly disable header .ne. addr check
;20881  ; 28    27-MAY-80
;20882  ;       Fix interlocked queues to properly page fault.
;20883  ; 27    Set stack flag on halt to tell console to attempt restart/boot.
;20884  ;       Fix interlocked queues to set MM.NOINT before trying to clear lock.
;20885  ; 26    Initial release.

;22259
;22260  ; Rev.  Explanation
;22261  ; 23    Swap a couple un-constrained words with INIT.MIC to make a return -19
;22262  ;       work correctly.
;22263  ; 22    Fix SKPC to read longword aligned
;22264  ;       Fix MATCHC to compare src length with obj length as longwords
;22265  ; 21    Fix MATCHC to not clobber R0
;22266  ; 20    Optimize MATCHC fix
;22267  ; 19    Fix MATCHC to not immediately exit the instruction after it finds the
;22268  ;       SRC length  to be equal to zero.
;22269  ; 18    Fix MATCHC to exit the instruction immediately when the obj length >
;22270  ;       SRC length.
;22271  ; 17    Fix MATCHC FPD bug if bus error/fault in CS.C3 loop.
;22272  ; 16    Initial release.
                                        ;22273         .BIN

;25520
;25521  ; Rev.  Explanation
;25522
;25523  ; 29    The location of u-code 1312 & 1313 are not used.
;25524  ; 28    Set mm.noint for addp4 -(works for sub also) when writing
;25525  ;       across page boundary in reverse direction
;25526  ;       Merged some locations into common code to save 4 locations
;25527  ; 27    Set MM.NOINT during the write of CVTPL to avoid problem with
;25528  ;       the Write Crossing Page Boundry routine.
;25529  ; 26    Force some addresses and make some documentation changes
;25530  ; 25    Fix ASHP to take a reserved operand abort when dest len > 31.
;25531  ;       Fix CVTPS instruction to clear the Z-bit when SRC len > Dest len
;25532  ; 24    Whenever the src len > dest len and the source string is not equal
;25533  ;       to zero and the first byte after a possible zero byte is not an illegal
;25534  ;       ascii character then a reserved operand fault will occur.
;25535  ; 23    Fix CVTTP and CVTSP  illegal byte detection fixed in 22
;25536  ;       Fix CVTPS instruction to clear the Z-bit when source lenght = 1
;25537  ; 22    29-MAY-1980
;25538  ;       Fix CVTTP to zero upper nibble of 0 length result if a page fault
;25539  ;       occurs trying to write the result.
;25540  ;       12-JUNE-1980
;25541  ;       Fix CVTLP to always properly set/clear Z if overflow occurs.
;25542  ;       Fix CVTPS and CVTPT to properly set CC's if destination length = 0.
;25543  ;       18-JUNE-1980
;25544  ;       Fix CVTTP and CVTSP to take a reserved operand fault for all illegal
;25545  ;       bytes that overflow.
;25546  ;       Fix CVTPS and CVTPT to set Z if the srclen > dstlen and dstlen is even.
;25547  ; 21    Fix converts to save flags if interrupted with FPD set.
;25548  ;       Fix DIVP to take reserved operand if divide loop hangs do to
;25549  ;       illegal BCD digits.
;25550  ; 20    Initial release.
                                        ;25551          .BIN
